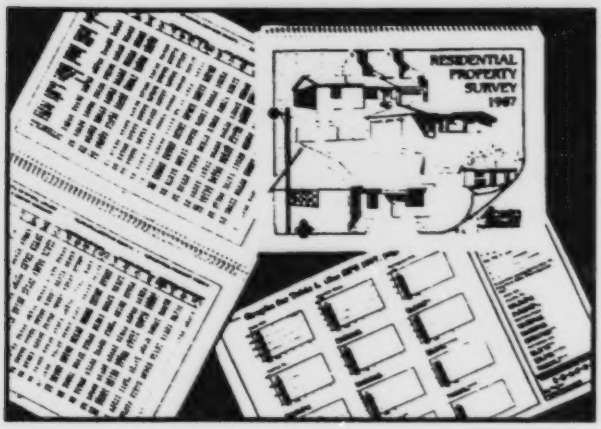
Residential Property Survey 1987



Residential Property Survey

This report contains comparative data on assessment, taxation and utility charges for a selected residential property. It also includes a variety of interpretive information about all Alberta municipalities.

G*R*A*P*H*S

These work sheets will assist you in comparing one selected bungalow in one municipality with another. They can also be used to compare properties with the average one identified in the report. Your observations can then be summarized on the right side of the work sheets.

A word from the Municipal Services Branch

This latest edition of the Residential Property Survey has been expanded to include more comparative statistics and indices than previous years. We're always striving for improved services to you the users and welcome any suggestions and comments from you.

To assist you in getting full value from the survey, more substantial notes have been added to the wealth of information the survey has always contained. Over 90 per cent of the municipalities in Alberta, including cities, towns, villages, summer villages, counties, municipal and improvement districts responded to our call for data and are featured in this year's edition. We have chosen a three-bedroom bungalow as the most common and useful residence on which to base comparisons of taxation and utility charges.

Over 90 per cent of the municipalities in Alberta ... responded to our call for data.

Additional data about each municipality, drawn from a variety of sources has also been included. For all of you who wish to build an understanding of the factors which lie behind the contrasts and the similarities between communities, this is an excellent tool.

Although we think we have a top-notch survey, it should be pointed out that it has not been possible to subject the data to comprehensive, detailed validation. We have basically relied on what was reported to us by the individual municipalities. Like us, I would ask that you accept the data at face value.

This is an excellent tool.

When you use the survey I suggest you pay particular attention to the main User's Guide as well as the complete introductions to each Part of the report. Through these you will develop a stronger appreciation of the quality and constraints associated with the data.

To you who supplied the data — thank you. To you who use it — good, rewarding reading.

John McGowan
Executive Director
Municipal Services Branch
Alberta Municipal Affairs

Planners (and other Professionals) who have municipalities as clients

What does this report mean to you?

This report represents a set of statistics about your clients — municipalities. Some of these statistics you may already be familiar with, but most certainly, some of them will be new. In either case, the report can assist in implementing policies and complement your planning advisory services to municipalities. In fact, the Residential Property Survey 1987 can be your "front line" reference as well as your source book of data analysis and policy review.

But how you ask? Let's refer to the report for the following highlights about towns in Alberta. By comparing one municipality to others, you can more readily appreciate its relative position using the following information.

The report can assist in implementing policies and complement your planning advisory services to municipalities.

TABLE I: Survey Summary (page 18-21)

Total Property Tax and Total Utility and Property Taxes — On a standard bungalow, how much do residents pay for the public services they receive? Planning policies and advice can have a significant impact upon these services.

TABLE II: Total Taxation (page 36-39)

Equalized Assessment per Dwelling — By equalizing the assessment base for each municipality, you will learn their comparative property wealth. By dividing the Equalized Assessment (E.A.) by the total number of dwellings, you have a wealth indicator (E.A.P.D W.) for urban municipalities.

Residential Equalized Assessment per Dwelling — This statistic includes only the residential assessment of towns, divided by the number of dwellings. The quality of the residential development in a town, when compared to an average, is indicated.

Personal Income Index — From Statistics Canada, this data is the average 1985 income for a town. It can serve as a crude measure of the average resident's ability to pay.

TABLE III: Municipal Taxation (page 54-57)

Equalized Assessment Mix — This describes the "business" or industrial portion of the total equalized assessment in the town. In the average town, about 33 per cent of the equalized assessment is business related. The balance — 67 per cent — is residential assessment. You now have a scale with which to measure how the town you are doing the planning for measures up. Is it above or below this equalized assessment mix? If the town encourages more businesses to locate there or existing ones to expand, this percentage should increase over time.

Equalized Assessment Trends — Can be used to flag achievements of a local economic development committee. This trend, as a percentage change for 1987 compared to the past several years, is presented for each town.

These statistics can be added to planners' information service and advisory kit for municipalities.

Statistics can be added to planners' information service and advisory kit for municipalities.

You can describe the personality of a municipality through the use of the information in the Residential Property Survey.

The foregoing statistics are only a few of the indicators available to you in this report. As well, there are work sheets which assist you to G*R*A*P*H the information. This in turn will enhance your data presentation and policy review.

RESIDENTIAL PROPERTY SURVEY 1987

ERRATA
(Errors in writing and calculation)

Note 1. Rounding has produced slight differences in individual and cumulative figures within and between tables.

Note 2. To revise the data indicated by this errata, you should refer to the introduction and user's notes section in this report. Also Cols. = columns of the tables where Col. 1 = municipalities listed on the left side and p. = page number.

		Should Read
TABLE I: SURVEY SUMMARY		
p. 22	Total Prop. Tax (Col. 5) for Villages (Group I) Avg. (reads 1522.97).....	**1167.58**
	Cols. 6 - 10 and 15 - 18 will be affected by this change; you can revise Cols. 6 - 10 with data on p. 109; and revise Cols. 15 - 18 using data on p. 94.	
p. 30	Sample (Hamlet) Total Prop. Tax (Col. 11) for Improvement District Avg. (reads 697.08).....	**643.46**
	Cols. 12 - 16 will be affected by this change; you can revise by using data on p. 116.	
TABLE II: TOTAL TAXATION		
p. 44	Total Prop. Taxes (Col. 2) for All Summer Villages Avg. (reads 856.49).....	**884.21**
	All figures in T.P.T. Index column (Col. 3) will be affected by this change; you can revise by dividing individual Total Prop. Taxes figures (Col. 2) by revised All Summer Villages Avg. Total Prop. Taxes (884.21).	
TABLE III: MUNICIPAL TAXATION		
p. 53	Total Municipal Tax (Col. 7) figures for Cities are given in wrong order. Reorder, summing cols. 12 and 13, p. 103 for individual cities.	**956.98**
	Column 8 will be affected by this change; you can revise by dividing revised column 7 figures by the All Cities Average Total Mun. Tax (reads 678.71).	
p. 61	Total Prop. Taxes (Col. 3) for Villages (Group IV) Avg. (reads 1093.71).....

Jarvis Building, 9925 - 107 Street, Edmonton, Alberta, Canada T5K 2H9 403/427-7794

It gives me great pleasure to transmit this report on the third annual **Residential Property Survey**. In the spirit of continuing experimentation, we have expanded the report to include more comparative statistics and indices. There are also more substantial notes to assist users in obtaining the greatest value from the wealth of assembled data. I am confident this report will be of considerable value to all those who wish to become more informed about the Alberta municipal government scene.

This comprehensive annual survey was initiated in part to overcome time-consuming ad hoc surveys which the Branch conducted in connection with specific studies done for small groups of municipalities. In its present form, the report constitutes a major data collection and dissemination service for the general benefit of all municipalities. The information in this report facilitates comparisons of taxation and utility charges for a standard residential property.

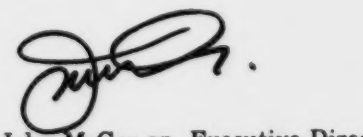
The additional context data, drawn from other sources, will be of particular interest to those wishing to build some understanding of what factors may lie behind the similarities and contrasts revealed by the survey data.

We will be making particular efforts this year to publicize the existence of this information, and to develop some "user-friendliness." As a result, we hope to reach a wider audience and to draw individual users into the body of the report to a more complete appreciation of what it has to offer. Assuming the report continues to be well received, we will be undertaking another survey for 1988. In this event we will again strive to publish the results earlier, ideally before the end of the year, to enhance the value of the report for municipal budgeting purposes.

The survey data presented are basically that reported by municipalities on the record sheets. It has not been possible to subject the information reported to a comprehensive and detailed validation. I would suggest, therefore, that you accept the data at face value, paying particular attention to the main User's Guide as well as the comprehensive introductions to each component of the survey report. These will lead you to a stronger appreciation of the qualities and constraints associated with the data. This applies also to the context data which have been drawn from non-survey sources, such as the Alberta Municipal Finance Information System (AMFIS), the Census of Agriculture by Alberta Agriculture, Alberta Education print-outs and the Royal LePage Survey of Canada House Prices.

As always I would welcome your comments and constructive criticism on the survey report and its usefulness. In this period of scarce resources and downsizing we are more conscious than ever of the need to carefully evaluate all our service efforts. The **Residential Property Survey** has become a major undertaking within the Branch and I am particularly interested in your feedback to determine if this effort can be justified in relation to the other demands.

In closing, I wish you good reading and fruitful comparisons. May I also extend our appreciation to the municipal officials who diligently completed the survey forms, making this report possible.



John McGowan, Executive Director
Municipal Services Branch
Alberta Municipal Affairs

USER'S GUIDE

THE USER'S GUIDE TO THE 1987 RESIDENTIAL PROPERTY SURVEY

1. Introduction

No two municipalities are the same. This report has been developed to enable comparisons of residential property assessment, taxation and utility charges. Assumptions need to be made to make meaningful comparisons among the data and among municipalities. This User's Guide and the introductions direct attention to the factors causing variability in the data. In turn, you are better able to attach confidence and meaningfulness to your comparisons.

Section 2 of the User's Guide highlights the presentation features of the tabulated data. Section 3 notes three steps for achieving reliability and confidence in your comparisons, while Section 4 describes the design of the survey and the response rate. Section 5 discusses the material not presented in this report but collected from the survey. For those municipalities not responding, some information has been estimated as described in Section 6. The last three Sections 7, 8 and 9 of this User's Guide furnish some of the technical notes. Specific details about the data are found in the introduction of each Part and Appendix.

2. Presentation of Data

This report consists largely of data. The use of consistent presentation techniques helps to make your comparisons even easier. For example, municipalities are arranged by population, and each municipal type (e.g. Municipal Districts) has been divided into groups of about 30 municipalities. Each page or group has an average along with the larger group average at the bottom of the page.

This grouping is convenient for municipalities located around the middle of each group (or page). Those at the bottom or the top of the pages may wish to consult the appropriate municipalities in adjoining groups of towns and villages.

Another "user friendly" feature in the introduction of each part is an illustrated User's Note. As a quick reference, a summary of the data by municipal types is presented. These notes also help you to use the data and detail how these statistics are calculated.

3. Three Steps to Comparability

The following three steps will increase confidence in your comparisons with the sample property, types of taxation and the municipalities.

Step 1: First ensure the properties are similar.

The bungalow properties you want to compare should have similar characteristics, in terms of Property Description (year built, size of bungalow and lot size). This data is found in Part I and Appendix 1.

The house type is common to all the properties reported. It has been referred to as a "standard project" (3c) bungalow.

> "The standard project home meets and occasionally exceeds minimum building requirements. The exterior usually has a typical style, and is generally rectangular in shape. The floor plan is functional. The finishes are normally limited to average quality pre-manufactured or standard materials, with a minimum number of decorative features. The total finished floor area for this class (3c) generally ranges from 90 to 190 square metres."

For **urban** municipalities, the sample residential property was further defined as a five to ten year-old 3c bungalow: approximately 110 sq. metres (1200 sq. feet); with a single garage (attached or detached); on a standard residential lot. This elaboration also applied to summer villages, the only exception being the reference to a standard lake-front lot. If this property was not present in a summer village, then reference was made to a **lake-front** residence as similar as possible to the one described. Additionally, for summer villages, separate data were requested on a **permanently** occupied residence and a **seasonally** occupied residence (the latter being a residence occupied in total for less than six months in a year).

The basic property definition used for urbans also applied to rural municipalities. However, data were requested for two types of rural properties: i) a three-acre parcel, and ii) a standard residential lot in either a designated hamlet or other unincorporated "urban community."

Selection of the particular residential property or properties was locally determined. The data reported in each case is broadly comparable to the extent that each sample property conforms to the specifications of the defined property. Some variability due to the selection factor is inevitable, but the intent of the sample property specification was to limit the influence of this factor to minor proportions.

Step 2: Secondly, ensure the properties you are comparing have similar types of taxes and costs.

Apart from the property selection factor discussed in Step 1, you should be comparing properties with similar types of taxes. As noted in Part I: Survey Summary and in Appendix 1, there are two types of property costs and utility charges. Thus, for example, comparable properties should either all have, or not have, special levies or solid waste charges.

The comparability of taxation levels may be influenced by any one or more of the following factors:

i) the currency of the property assessment value, and/or
ii) the presence or absence of special assessments and local improvements, i.e.: special municipal levies, and/or
iii) the incidence of extraordinary or other special requisitions, e.g. by a hospital district authority.

Any remaining variability can be interpreted as being a function of differences in:

i) the range of tax – supported services provided by the municipality
ii) the level at which these services are provided
iii) the method of service-delivery, e.g. volunteers/ community associations, or full-time municipal staff; private contractors or municipal staff; and
iv) the financing approach, e.g. general benefit versus property-owner benefit, and the associated tax burden; or pay-as-you-go capital works financing versus debenturing.

The general fiscal policies of a municipality may also have a significant bearing on the level of taxation. For example, the level and utilization of capital or operating reserves. Similarly, the age of the municipality's infrastructure can be a major factor.

No attempt has been made in this survey to gauge such service-profile/financing strategy detail. However, its importance should be borne in mind when making comparisons between municipalities.

Step 3: Thirdly, ensure the municipalities are similar.

From Step 1 and 2 you have identified a few municipalities with similar properties and taxes. As you compare the statistics in Parts I to V, ensure the municipalities are similar too. This is done by using the municipality-wide context data and indices.

The context data are derived from sources other than the survey record sheets. They ensure some information is available for non-responding municipalities. It also assists in better explaining or understanding some more extreme differences in the reported results. These statistics include fiscal capacity indicators, assessment mix, and unit taxation levels.

Refer to the introduction of each Part and Appendix for the particular details.

4. Survey Design and Response

As in the case of the two previous survey reports, this 1987 survey covers all Alberta municipalities. Three separate surveys or records were used for: i) urban municipalities (cities, towns and villages); ii) summer villages; and iii) rural municipalities (counties, municipal districts, improvement districts and special areas). A sample of each survey is included in this User's Guide (pages 9 to 12).

The record sheets were improved by incorporating many of the municipalities' suggestions from the 1986 survey. In general, the opinions expressed were very positive with regard to the usefulness of the surveyed data. Specific uses mentioned frequently were for: general policy formulation; determination of broad taxation strategies and basic approaches to utility charging; setting rate structures; and guidance in the budgeting process.

A response to the surveys, sent out in September 1987, was requested for mid-October. Telephone contact was made with a number of non-respondents.

Response to the 1987 Survey

	Total Possible	Returns	Response Rate (%)
	#	#	%
Urbans:			
Cities	17	17	100
Towns	108	108	100
Villages	122	122	100
Summer Villages	50	28	56
Subtotal	297	275	93
Rurals:			
Counties	30	30	100
Municipal Districts	20	20	100
Improvement Districts	18	15	83
Special Areas	1	1	100
Subtotal	69	66	96
GRAND TOTAL	366	341	93

As you can see from the summary, the overall response was very high, at 93%.

5. Unreported Surveyed Information

Other information was collected in the survey. Due to time constraints some of this material is not in this report. It includes actual utility charges and pricing schedules on the sample property, details on a three-acre parcel in the rural municipalities and a seasonally-occupied residence in summer villages. This unreported information can be made available to you upon request. You can also access the Municipal Services Branch files of utility bylaws and schedules, collected for about one-third of all municipalities.

6. Imputed Responses

In consultation with 22 towns and villages, this Branch filled out their survey forms to make the data base more complete.

The necessary calculations were based on the municipalities' 1986 Residential Property Survey response. We ensured there was no general reassessment nor changes to the tax pattern for the sample property. The urban centres with an imputed survey response included 8 towns (i.e. Calmar, Coronation, Morinville, Penhold, Pincher Creek, Stony Plain, Swan Hills, Westlock) and 14 villages (i.e. Radway, Paradise Valley, Alliance, Grassy Lake, Carmangay, Strome, Kinuso, Edgerton, Duchess, Riley, Mirror, Onoway, Stirling, Forestburg).

7. Alphabetical List of Municipality Populations

The data in Parts I to V are presented by municipality from highest to lowest population. To assist you in finding a particular municipality, refer to Appendix 1. Here the municipalities are listed alphabetically, along with their populations.

8. Technical Notes and Abbreviations

The following notes help clarify some of the data deficiencies in the tables and assist you in interpretation. Listed below are points which apply generally to several tables and statistical data. Additional explanation is included in the introductions for each of the Parts and the Appendices

Averaging: The municipalities are listed in order of population size (highest to lowest). Each page has about 30 municipalities which are considered a group. In the Summary Table (Part I) for example, the average is reported for each group on each page. An overall average is also reported which means the average of all similar municipal types (for example, all towns). In all cases, the average is calculated only for the municipalities reporting data.

Blank spaces, N/A, n/a, or "0" in the tables: Throughout the report these following phrases are roughly synonymous. Not Submitted By The Municipality, Not Applicable, Not Available, or N/A. In some instances blanks are used as well as "0."

Depending on the circumstances, the data may or may not have been reported where the question was felt to be inappropriate for that municipality. Regardless of the method used to describe this situation, no data were entered. In some cases this means further refinement for the survey may be needed. In other cases, involving Summer Villages unincorporated at the time to which the data refer, such data simply did not exist. This latter

situation applies to the Summer Villages of Bondiss, Island Lake South, Jarvis Bay, Parkland Beach, and South Baptiste.

Dollar amounts: All dollar amounts refer to 1987 nominal or current dollars as reported by the municipality. However, most of the context data refer to 1986 nominal dollar amounts.

Rural utility data: Given the limited number of rural municipalities with utility systems related data on utility charges and the associated rates were not recorded in this report.

Standard measure and conversions: Metric is the standard unit of measure found in this report. The following are conversion factors into the Imperial measure for area and volume:

one hectare (ha) = 2.47 acres or 10,000 square metres
one acre (ac) = 0.4 hectares
one metre = 3.281 feet
one foot = 0.305 metres
one square metre (sq. m) = 10.764 square feet
one square foot = 0.093 square metres
one cubic metre (cu. m) = 220 gallons
1000 gallons = 4.55 cubic metres
All of the above conversions are approximates.

Abbreviations and Short Forms: Both are found throughout this report. Refer to the introductions of each Part and the Appendices for an explanation of the abbreviations and short forms found in the tables.

Any and all suggestions, comments or other queries relating to the survey should be directed to:

9. Survey Instruments

Alberta
MUNICIPAL AFFAIRS

1987 RESIDENTIAL PROPERTY SURVEY
URBAN MUNICIPALITY RECORD SHEET

NAME OF MUNICIPALITY: _____ (Please complete)

PART A. SAMPLE RESIDENTIAL PROPERTY: Please provide information for a SAMPLE RESIDENTIAL PROPERTY representing a five to ten year-old standard project (SC)[1] bungalow; approximately 110 sq. metres (1200 sq. feet); with a single garage (attached or detached); on a standard residential lot in your municipality (see footnote).

1. ASSESSMENT (1987 Tax Year) for the SAMPLE RESIDENTIAL PROPERTY.

1.1 Year Last General Assessment became effective for taxation purposes: 19___

1.2 Land Assessment Value $ _____ 1.5 Year of Construction: 19 ___

1.3 Bldg./Imp. Assessment Value $ _____ 1.6 Size of Residence: _____

1.4 Total Property Assessment Value $ _____ 1.7 Size of lot: _____

2. TAXATION (1987 Tax Year) for the SAMPLE RESIDENTIAL PROPERTY.

	MILLS	TAXES
2.1 Supplementary School Taxes	_____	$ _____
2.2 Other Requisitions*	_____	$ _____
2.3 Special Assessments and Local Improvements**	n/a	$ _____
2.4 Municipal Taxes***	_____	$ _____
2.5 Total Property Taxation	_____	$ _____

* To cover Provincial Planning Fund, general and auxiliary hospitals, nursing homes and seniors foundations requisitions.

** To cover frontage taxes, special frontage assessments and special local benefit assessments where such charges apply to a majority of the properties in the municipality in the same age-range as the sample property.

*** To cover the general municipal tax levy, including any generally applied but specifically identified rates such as for recreation, fire, debt service, etc.

3. UTILITY CHARGES

Indicate the annual (i.e. 12 months accumulation) charges to the SAMPLE RESIDENTIAL PROPERTY.

3.1 Water* ..... $ _____

3.2 Sewer* ..... $ _____

3.3 Solid Waste Collection* .. $ _____

3.4 Total Charges ..... $ _____
(for above services only)

* Do not include any charges included in property taxation.

3.5 Approx. annual water consumption of residence _____ cu.m. (Conversion: 1 cu m = 35.3 cu. ft. or 220 gals. or 1000 litres.)

3.6 Approx. annual RESIDENTIAL water consumption, if available, for the ENTIRE MUNICIPALITY _____ cu. m.
N.B. This information will be used to develop another comparative statistic, e.g. consumption per capita or per dwelling.

1 The standard project home meets and occasionally exceeds minimum building requirements. The exterior usually has a typical style that is generally rectangular in shape. The floor plan is functional. Finishes are normally limited to average quality pre-manufactured or standard materials and a minimum number of decorative features may be encountered. The total finished floor area for this class generally ranges from 90 to 100 m².

4. MARKET VALUE OF PROPERTY

4.1 Estimated present market value of the SAMPLE RESIDENTIAL PROPERTY * $ _____

* It is recognized that location within certain areas, in larger municipalities especially, influences the market value of properties. Given this fact, please provide the AVERAGE market value for properties fitting the sample property description, using your own or another person's informed knowledge of local real estate values.

PART B. UTILITY RATE SCHEDULES:

5. NOTE: Please update the requested by-law and rate schedule information in effect at the end of 1986 and/or reported in last year's Residential Property Survey, either by indicating, wherever appropriate, "NO CHANGE" or by SUPPLYING AMENDED INFORMATION briefly describing the RESIDENTIAL pricing schedules presently in effect and how often you bill per year. Please attach a copy of the pertinent by-law(s) if a change has occurred. A by-law/schedule information file will be maintained for access by interested municipalities.

	Billings/year
5.1 Water Service _____	_____
5.2 Sewer Service _____	_____
5.3 Solid Waste Collection Service _____	_____

1987 RESIDENTIAL PROPERTY DATA SURVEY

SUMMER VILLAGE RECORD SHEET

NAME OF MUNICIPALITY: _____ (Please complete)

PART A. SAMPLE RESIDENTIAL PROPERTY: Please provide information for a SAMPLE RESIDENTIAL PROPERTY, representing a five to ten year-old standard project (IC)[1] bungalow; approximately 110 sq. metres (1200 sq. feet); with a single garage (attached or detached); on a standard LAKEFRONT LOT. If this type of property is not found in your municipality, then refer to a lakefront residence that is as similar as possible to the one described. Please provide information for both a PERMANENTLY OCCUPIED RESIDENCE and for a SEASONALLY OCCUPIED RESIDENCE (occupied less than six months a year). (See footnote.)

1. ASSESSMENT (1987 Tax Year) for the SAMPLE RESIDENTIAL PROPERTY.

1.1 Number of PERMANENTLY OCCUPIED residences _____, and TOTAL residences _____ in municipality.

1.2 Year Last General Assessment became effective for taxation purposes: 19 ___

	PERMANENT RESIDENCE	SEASONAL RESIDENCE
1.3 Land Assessment Value	$ _____	$ _____
1.4 Bldg./Imp. Assessment Value	$ _____	$ _____
1.5 Total Property Assessment Value	$ _____	$ _____
1.6 Year of Construction:	19 ___	19 ___
1.7 Size of Residence	_____	_____
1.8 Size of Lot	_____	_____

2. TAXATION (1987 Tax Year) for the SAMPLE RESIDENTIAL PROPERTY.

	MILLS	TAXES Permanent	TAXES Seasonal
2.1 Supplementary School Taxes	_____	$ _____	$ _____
2.2 Other Requisitions*	_____	$ _____	$ _____
2.3 Special Assessments and Local Improvements**	n/a	$ _____	$ _____
2.4 Municipal Taxes***	_____	$ _____	$ _____
2.5 Total Property Taxation	_____	$ _____	$ _____

* To cover Provincial Planning Fund, general and auxiliary hospitals, nursing homes and seniors foundations requisitions.

** To cover frontage taxes, special frontage assessments and special local benefit assessments where such charges apply to a majority of the properties in the municipality in the same age-range as the sample property.

*** To cover the general municipal tax levy, including any generally applied but specifically identified rates such as for recreation, fire, debt service, etc.

---

1 The standard project home meets and occasionally exceeds minimum building requirements. The exterior usually has a typical style that is generally rectangular in shape. The floor plan is functional, finishes are normally limited to average quality pre-manufactured or standard materials and a minimum number of decorative features may be encountered. The total finished floor area for this class generally ranges from 90 to 190 m^2.

3. MARKET VALUE OF PROPERTY

3.1 Estimated present market value of the SAMPLE RESIDENTIAL PROPERTY $_____*

Permanent Residence $ _____ Seasonal Residence $ _____

* It is recognized that location within different areas of the same municipality may influence the market value of properties. Given this fact, please provide the AVERAGE market values for properties fitting the sample property description, using your own or another person's informed knowledge of local real estate values.

PART B. IN YOUR OPINION: With reference to the 1986 Residential Property Survey.

4.1 Was last year's survey report shared with (check):

Council: Yes ___, or No ___; Local Media: Yes ___, or No ___.

Administration: Yes ___, or No ___.

4.2 How would you rate the value/usefulness of the report? (check):

High ___; Moderate ___; Low ___; Nil ___.

4.3 How was the report actually used by the Administration: _____

_____

by the Council: _____

_____

4.4 How could the scope/content/wording/timing of the survey and report be improved to enhance its usefulness? _____

_____

_____

4.5 How often should the survey be repeated? (check):

Every year ___; Every few years ___; Not at all ___.

PLEASE RETURN SURVEY BY OCTOBER 9, 1987
AND ADDRESS ANY INQUIRIES TO:

Municipal Services Branch, Alberta Municipal Affairs, 11th Floor, Jarvis Building
9925 - 107 Street, EDMONTON, Alberta T5K 2M9 Telephone: 427-7794

THANK YOU FOR YOUR PARTICIPATION!

PART I:
SURVEY SUMMARY

PART I: SURVEY SUMMARY

Introduction

Property taxes and utility charges data from the survey are described and presented in this part.

For each sample property surveyed, **total property taxation** is broken down into its major components:

- special municipal levies or assessments;
- general purposes municipal taxes;
- supplementary school requisitions; and
- other requisitions (e.g. for planning, hospitals).

The **special municipal levies** relate to local benefit assessments and frontage charges. While most common in urban centres, they are usually restricted to parts of a municipality. They may apply, among other items, to: curb, gutter and sidewalk improvements; paving projects; lane lighting; water supply; and sewage collection.

General municipal taxes are based on a mill rate levy which applies across the board for all residential taxpayers in a municipality. These may include special operating or capital levies, earmarked for application to a specified function (e.g. debt reduction, recreation), but applied evenly across all taxable properties in a municipality.

Taken together, the special municipal levies and the general municipal taxes constitute **total municipal taxation**.

In all cases requisitions are collected by a municipality for another local government authority. The major requisition for residential property-owners is for **supplementary school purposes.** (Non-residential property owners are also subject to an additional requisition based on the School Foundation Program Fund levy). The school taxes paid in a municipality are determined by the local school authority(s). This is based on the extent to which that jurisdiction feels the need, or chooses, to supplement the provincial grant revenue. The provincial grants are intended to ensure the same basic (foundation) level of education across Alberta. The amount of supplementary school taxation is also a function of the school jurisdiction's assessment base. As for municipalities, some school jurisdictions are better endowed than others in terms of the extent and mix of assessment. As a result, the same requisition amount can translate into very different supplementary school taxes for otherwise similar residential taxpayers located in different jurisdictions.

Other requisitions are normally quite minor in significance in comparison with those for supplementary school purposes. They relate to requisitions for the Provincial Planning Fund, general and auxiliary hospitals, nursing homes, and senior citizen foundations.

Utility service charges are normally an added cost in most urban communities. Usually the utility charges recover operating costs (including any debt service charges). Occasionally they may also cover the buildup of reserves for future renovation or replacement works. Total utility charges covers water, sewer, solid waste collection and disposal. The latter service costs are often covered by general municipal taxation.

The **water and sewer charges** have been calculated from the municipalities' 1987 rates for a standard annual consumption value. This standardization smooths out the influence of different consumption patterns and household sizes. The standard annual volume is 360 cubic metres of water (79,200 gallons). Sewer charges are generally tied to water consumption or are charged at a specified percentage of the water bill.

Municipalities are encouraged to operate their water and sewer utilities as self-financing enterprises. However, many choose to set their rates so that part of the costs have to be covered by general taxation. This practice raises the importance of **total aggregate local government costs** (being the sum of utility charges and property taxation) in any comparative analysis. Along with the aggregate perspective provided in Table I, the relative importance of each of the two major cost components is presented.

Two main summary statistics produced in Table I use market value. Total property taxation and aggregate local government costs are related to the reported **market value** of the sample property. However, some municipalities did not report market value information because of limited real estate activity

in such properties in their area. Some municipalities have also communicated a reticence to provide, or a difficulty in establishing, reliable market values, under prevailing recessionary conditions. In many cases therefore the figures reported should be treated as more of a "guesstimate" than a firm estimate.

Supplementary information on tax or cost incidence in relation to market value is presented in **Appendix 2**. This is based on an analysis of house price and taxes data published quarterly by Royal LePage for a large number of Canadian centres. It includes 13 neighbourhoods in Calgary, and seven in Edmonton, along with 11 other large Alberta centres. The information presented is for a detached bungalow similar to the standard sample property for this report.

The data used to calculate the percentages in Table I are found in other parts of this report. The various taxation components and market values are specified in Appendix 1, while the utility charge components are detailed in Part V.

The only context data presented in Table I are the **official 1987 populations** and the **service centre classifications**. The service centre classification can assist in your comparisons by ensuring further municipal similarity. These have been derived from **A Spatial Analysis of Service Centres in Alberta**, 1986 by Wayne K. Davies, Professor of Geography, University of Calgary (April, 1987). The eight classifications, in order of importance are listed below:

METRO: - metropolitan (Calgary;Edmonton),
REG: - regional service centre
S. REG: - sub-regional service centre
DIST.: - district service centre
S. DIST: - sub-district service centre
L. LOCAL: - large local service centre
LOCAL: - local service centre
MINOR: - minor service centre.

PART I: USER'S AND TECHNICAL NOTES
SURVEY SUMMARY

• Expect to see similar sized (pop.) centres with the same classification.

• Alberta Municipal Affairs (Nov. '87)

• Components of Total Property Tax of the sample bungalow for each municipality.

• Compare the total and these percentages with other municipalities to appreciate the tax burden and where the tax dollars go.

• See last column and text below.

• Composed of the annual utility charges on the sample property.

• Compare the total and these percentages.

• Composed of annual total costs of both property tax and utility charges.

• Compare the total and these percentages.

• The higher the number, the greater the tax/cost burden in relation to market value of the bungalow.

• Municipalities are listed by population (Hi to Lo).

• Appendix 1 has an alphabetical list of municipalities.

• Estimated resale value of the bungalow (as detailed in the User's Guide of this report).

• Eight economic classifications differentiate urban centres by the number and type of businesses. See introduction to Part I for details.

• Annual water and sewer service charges for a standard volume. These utility charges only apply to urban municipalities.

• Total taxes as a % of market value for the bungalow property. The tax incidence for property tax (left) and total costs (right) are shown.

• Other requisitions are taxes collected by the municipality for regional and provincial authorities (e.g. Planning Fund, auxiliary hospitals, nursing homes).

• General municipal taxes are for services benefitting all residents (e.g. police, parks).

• Supplementary school requisitions are collected by the municipality for the school authority.

• Frontage charges and local benefit assessments to property (e.g., sidewalk improvements).

• Total property tax includes requisitions, special levies and general municipal taxes on the sample bungalow.

PART II:
TOTAL TAXATION

PART II: TOTAL TAXATION

Introduction

Featured in Part II are the Total Property Taxes established through the survey for the sample property for each municipality.

Total Property Taxes (T.P.T.) includes general municipal taxes, all school requisition taxation, special property-assessment-based municipal levies or charges, and the taxes necessary to cover other requisitions (eg. for planning, hospitals, nursing homes).

The **TPT Index** indicates the situation for an individual municipality relative to the group average. In addition, the index value relates to information for a particular residential property which may not necessarily apply to all properties in aggregate — either within the broad residential category, or among all property categories (industrial, commercial etc.).

The **Total Equalized Mill Rate** (T.E.M.R.) expresses the grand total property taxes (and grants-in-lieu) levied and received by a municipality, as a mill rate based on total equalized assessment. It is a generalized total or aggregate rate, lumping together all types of property. The statistics presented employ 1986 financial statement data derived from the Alberta Municipal Financial Information System (AMFIS) and 1987 equalized assessments (prepared annually by the Assessment Equalization Board). Because of the complexities of the process, equalized assessments for a given year reflect the actual assessment situation prevailing about two years previous.

The **Residential Equalized Mill Rate** (R.E.M.R.) is a more specialized equalized mill rate dealing only with all residential (and farmland) properties in aggregate. Such property is often favoured by lower rates. This occurs because business may be subjected to higher rates under a split mill rate situation, as well as having to pay the School Foundation Program Fund Levy. The equalized residential (plus farmland) mill rate is computed by isolating all taxes raised from residential and farm properties (including mobile home licence fee revenue, and special property-assessment-based revenue). These taxes are expressed as an equalized mill rate by reference to that part of total equalized assessment which is **not** subject to the School Foundation Program Fund Levy.

The **R.E.M.R. Index** is of particular value in comparison with the T.P.T. index which refers to total property taxes for the sample property. In a perfect world the index values in each column would be similar for a given municipality. To the extent that there are discrepancies, questions may be raised. On the one hand, they may be related to the representativeness and comparability of the sample property used to furnish the survey data. On the other hand, the accuracy and consistency of the assessment equalization and financial reporting processes may be suspect. Depending on where the balance of confidence rests, a user may prefer, in large discrepancy situations, to favour either the Total Property Taxes Index or T.E.M.R. and R.E.M.R. indices.

There should also be some comparability between the total property taxes data for the sample property and the statistic expressing **residential taxes per dwelling** (R.T.P.DW.). The latter statistic is derived by isolating the tax levies classified as residential (from AMFIS) and relating these to the total number of dwellings in each municipality. The data refer to 1986 municipal financial statements, and again includes mobile home licence fees and special assessments revenue as part of residential taxation. The dwelling unit data are also for 1986.

The residential taxes per dwelling statistic is not fully comparable with the survey-derived total property taxes. The latter is for 1987 while the former indicates a 1986 situation. Also, the statistic totals all residential taxes and all dwelling units. The survey information relates to a single and particular residential property. Comparability would also be limited to the extent that there is a wide variation in the type and quality of residential development. Part of the utility of the statistic is in relation to those cases which have not submitted a survey return.

In terms of beginning to explain some of the differences indicated by the above statistics, a useful first reference base is information on **fiscal capacity**. This type of statistic furnishes the best readily available indicator of the relative ability of any given municipality to provide a standard "basket" of municipal goods and services, for any given standard level of taxation. Table II provides two measures of property assessment-based

fiscal capacity, and one measure related to personal (taxable) income.

Equalized assessment per dwelling (E.A.P.DW.) relates the amount of assessment to the number of dwelling units — the major source of demand for services in virtually all municipal settings. The net costs involved ultimately require taxation which has to be raised from the available assessment base. This base may consist of varying proportions of commercial, industrial and institutional property as well as the predominant residential (and farmland) property. The larger the assessment base overall, and the greater the non-residential portion, the better off will be the average residential (or farm-based) taxpayer. This could be in terms of the prospects for comparatively low levels of taxation, or better service levels. The **E.A.P.DW. Index** values show at a glance how each municipality is positioned in terms of property-based fiscal capacity. The assessment mix aspects are detailed in PART III.

A variety of fiscal capacity statistics can be developed based on equalized assessment. It is quite common to refer to per capita statistics for urban municipalities and per road kilometre (serviced by the municipality) in the case of rurals. These are among the statistics included in a separate publication, **Equalized Assessment Statistics 1987**, which is available upon request from the Municipal Services Branch of Alberta Municipal Affairs.

Because of the residential property focus of the present survey, a special fiscal capacity statistic has been calculated to indicate the equalized assessment value of the average dwelling in each municipality, i.e. the **residential equalized assessment per dwelling** (**R.E.A.P.DW**.) statistic and the Index.

The R.E.A.P.DW. statistic is generated by reference to the portion of total equalized assessment which is not subject to the School Foundation Program Fund Levy. It has some potential as a rough indicator of the average quality of the residential environment in a given municipality. In this respect, it can act as a means of gauging the extent to which the general range and level of municipal services differed from an average or basic "basket" of municipal "goods and services." Depending on the collective local preference, municipalities can be perceived as ranging along a continuum from "deluxe" or "Cadillac" to "economy" or "Beetle."

Further perspective on a community's fiscal capacity can be obtained by reference to relative personal income levels. These have a bearing on taxation capacity as well as indicating what may be driving a particular stance on service levels. Table II includes **personal income indices**, based on 1985 income tax data. This information has recently become available from the Small Area and Administrative Data Division of Statistics Canada (Catalogue 17-602; issue 87-004).

The Personal Income Index refers to the median income of all tax filers reporting income in each urban municipality where the provincial average is equal to 100. For the rurals, no municipality-wide average was reported. However, a weighted average has been computed based on the published data for small areas within each rural municipality.

PART II: USER'S AND TECHNICAL NOTES
TOTAL TAXATION

• There is some comparability with the T.P.T. of the sample property. Refer to the introduction for its limitations.

• These property tax-base indicators show the relative ability of a municipality to provide a standard "basket" of goods/services for a standard level of taxes.

• The higher the E.A.P.DW., the better off the average residential taxpayer.

• Compare Actual as well as Index figures with the averages.

• R.E.A.P.DW. roughly indicates the average quality of residential development.

• Compare T.P.T. using the $ amounts or the index relative to the group averages at the bottom of the page.

• These mill rates are for the entire municipality and are not directly comparable to a sample property.

• The R.E.M.R. Index should be similar to the T.P.T. Index. If the difference is large, favour either the T.P.T. Index of the T.E.M.P. and R.E.M.P. Indices.

Municipality	Sample Property		Comparative (Equalized) Mill Rates				Unit Taxation	Fiscal Capacities: Property-based				Income-Based

• Use the municipality's population to locate it in Parts I to V. Municipalities are listed by population (Hi to Lo).

• Appendix 1 has an alphabetical list of municipalities.

• Total property tax includes taxes from requisitions, special assessment levies, and general municipal purposes on the sample bungalow.

***** • Total property taxes and grants-in-lieu of a municipality divided by its total equalized assessment.

***** • Special mill rate for all taxes from residential (and farmland) properties (incl. mobile home license fees and special assessment revenues) divided by the total residential (non-SFPF) equalized assessment.

***** • Taxes from residential properties (incl. mobile home licenses and special assessment revenues) divided by the total dwellings in a municipality. For Summer Villages, the number of parcels with residences was used instead of dwellings.

***** • Total equalized assessment of a municipality divided by the total dwellings. For Summer Villages, the number of parcels with residences was used instead of dwellings.

***** • Residential (non-SFPF) equalized assessment divided by the dwellings in a municipality.

• Based on the middle income level in a municipality: Prov. Avg. =100. (Statistics Canada)

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

PART III:
MUNICIPAL TAXATION

PART III: MUNICIPAL TAXATION

Introduction

Table III features the municipal taxation component of total property taxation. It encompasses both **general municipal taxes** and **special municipal levies**. The latter element is highly variable and deserves to be closely monitored in any comparisons. For many municipalities, special levies are not used. In others, they may play a major role in the allocation of particular service costs. The table identifies the percentage of total property taxes accounted for by the special levies.

In most cases, general municipal taxation is the major, if not sole, component of the **municipal taxation** applicable to the sample property. Note however, municipal taxation is not always the major component of total property taxation: this status occasionally applies to supplementary school taxation. (See Parts I and IV for details regarding this latter point.)

Total municipal taxation, in dollar terms, is specified in Table III, along with the applicable relative index. This survey-based information is complemented by the **equalized municipal taxation mill rate**, (E.M.T.M.R.) as derived from 1986 AMFIS data. The rate was generated by referencing the 1986 "Balance of Levies for Municipal Purposes" and converting this to a mill rate equivalent by using the total 1987 Equalized Assessment.

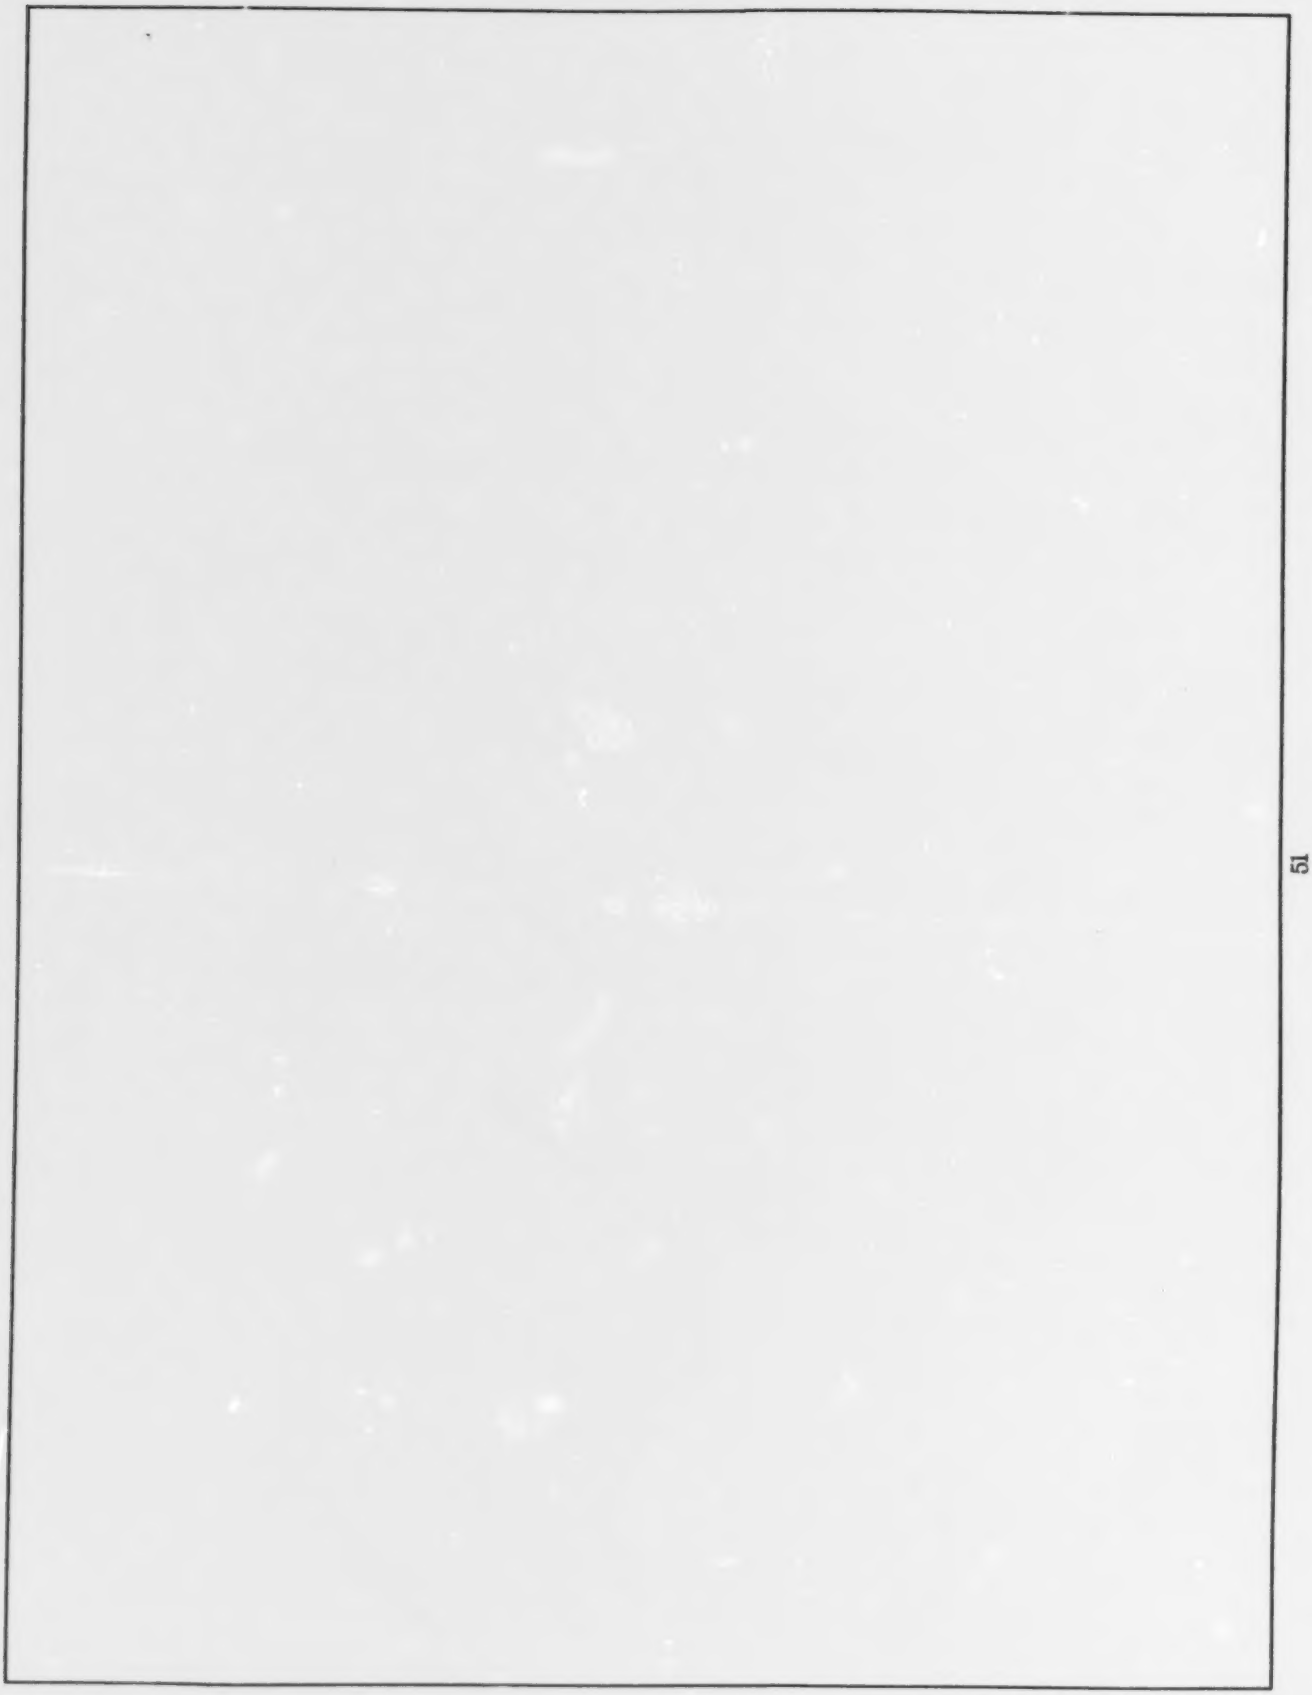
There is some theoretical basis for comparability between the indices developed for total municipal taxation (from the survey) and the **E.M.T.M.R. Index**. It should be noted, however, that the reference year varies slightly. Also, the equalized mill rate involves a reference to all types of property, rather than simply residential property.

There is also some basis for comparability between the **total municipal taxation** (T.M.T.) **index** and the **residential equalized mill rate** (R.E.M.R.) **index** presented in Table II. In this case, however, the R.E.M.R. Index references all residential taxation (i.e. including requisitions), rather than simply the taxation for municipal purposes.

The main context data in Table III features information on **assessment mix** and **general assessment trends**. The information is based on equalized assessment figures. Assessment mix refers to the percentage of total equalized assessment which is subject to the School Foundation Program Fund Levy. This levy applies to all industrial, commercial and other non-residential (or non-farmland) properties. From the residential tax-payers' perspective, the greater the non-residential assessment mix the lesser will be their taxation burden, for the same basket of municipal goods and services (and the associated costs). The non-residential assessment percentages are presented for 1982, 1985 and 1987. Some appreciation of recent trends may be gained in this key taxation context.

Residential taxes are also sensitive to changes in the total assessment base. A growing base brings the prospect of lower taxes, or better/more services for the same outlay. A shrinking assessment base means the likelihood of higher taxes simply to maintain the status quo, or cuts in the level and range of services to keep tax rates stable.

The equalized assessment trend information is presented for three time periods: the past five years (1982-87); the past two years (1985-87); and the past year (1986-87). For the province as a whole, equalized assessment exhibited high annual growth rates until about 1983/84. Since then it has either declined or exhibited very modest increases. When interpreting individual cases the possibility of large changes due simply to annexations, or general re-assessments, should be borne in mind.



PART III: USER'S AND TECHNICAL NOTES
MUNICIPAL TAXATION

• Alberta Municipal Affairs (Nov. '87)

• Compare the total and the percentages with other municipalities and the group average.

• Use the G.M.T. % TPT Index for a quick reference.

• Ensure properties are comparable by having the same mix of taxes. Sometimes Special Levies can be very significant, while in other cases they are absent.

• Either Municipal Taxation or Supplementary School Requisitions furnish the major component of Total Property Taxation.

• The T.M.T. Index for the sample property and the E.M.T.M.R. Index (municipal-wide) may be comparable.

• The E.A. Mix indicates the "business" or "industrial" portion of a municipality's tax base.

• Generally, the greater this %, the lower will be the residential taxes for the same "basket" of municipal goods and services.

• Equalized Assessment Trends help one appreciate the taxation content. A growing assessment base could mean lower taxes or the same service levels. A declining base may be accompanied by higher taxes and/or cuts in services.

• Large changes may be due to annexations or general re-assessments.

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

• Total Property Tax includes requisitions, special assessments and general municipal taxes.

• General Municipal Taxes are for projects/expenditures benefitting most or all of the municipality.

• Special Levies are local benefit assessments and frontage charges (e.g. sidewalks, street-lighting, lane paving, etc.).

• General Municipal Taxes plus (+) Special Levies on the sample property for 1987.

• From AMFIS — Balance of Levies for Municipal Purposes (1986) is divided by the Total Equalized Assessment for the municipality.

• The "business" or "industry" portion of the equalized assessment subject to the School Foundation Program Fund Levy is presented for 1982, '85 and '87.

• The % change in total equalized assessment over the three periods is indicated. (Bracketed figures signify decreases.)

PART IV: SCHOOL TAXATION

PART IV: SCHOOL TAXATION

Introduction

School taxation refers to the **supplementary school requisition** (S.S. Req.) elements of the total property tax bill. The requisition is made by the school jurisdiction with which a particular municipality may be associated. Where several jurisdictions are involved it is possible that similar standard residential properties will be subject to different supplementary requisition amounts, depending on what school jurisdiction the tax-payer has opted to support. In multi-jurisdiction settings it should be assumed that the survey property supplementary school requisition shown reflects the most represented school jurisdictions' situation (the "representative" rate).

The **S.S. Req. Index** enables a quick appreciation of the position of individual municipalities in relation to the group average — as far as the sample property situation is concerned. Also, the percentage statistic (**S.S. Req. as a % of T.P.T.**), indicates the relative significance of school taxes in the total property tax bill.

For a broader perspective, AMFIS data have been used to develop an equalized mill rate (**S.S.R.M.R.**). It has been computed using the total 1986 supplementary school requisitions for each municipality, in relation to 1987 total equalized assessments. It represents an aggregate situation, embracing all supplementary school requisitions, by every supported jurisdiction, and all taxable properties. The statistic also provides some comparative information for those cases where there was no survey return.

A **S.S.R.M.R. Index** cannot necessarily be compared directly with the S.S. Req. Index for the survey property. The latter reflects 1987 circumstances, while the former pertains to 1986. The survey property is a pure residential value, while the equalized mill rate is computed on the basis of all taxable properties.

Discrepancies may also arise because of abrupt shifts associated with general re-assessments.

The school tax on the sample property is also shown as a percentage of the market value, (**S.S.R. as a % of Market Value**). This tax incidence statistic has some value as a means of gauging the representativeness of the sample property selected, and the accuracy of the market value. In a perfect world, this statistic should be similar for municipalities supporting the same school jurisdiction. Where discrepancies are noted these may be attributed to poor conformance with the sample property definition and/or inaccurate market value estimates. There is also the possibility that assessments may be particularly outdated in the municipality. However, the greatest variations with this statistic are expected between municipalities in different school jurisdictions.

In Table IV reference is made to the predominant school jurisdiction supported by each municipality. This assignment was based on the school jurisdiction claiming the largest proportion of a municipality's equalized assessment for school purposes. In most cases this was straightforward. But for some rural municipalities, especially Improvement Districts and the Special Areas, there were several jurisdictions closely ranked with one another. This meant, in some cases, the selected jurisdiction accounted for a relatively small proportion of the total assessment base: nevertheless, it was deemed to be the predominant jurisdiction.

The **school jurisdiction code** involves a prefix — from 1 to 6 — before the decimal point. These numbers refer to the Alberta Education Zone. The first digit after the decimal point indicates the status of the school authority as follows:

1. School Division
2. County
3. Public School District
4. R.C. Separate School District
5. Consolidated School District
6. R.C. Public School District
7. Protestant Separate School District
8. Regional School District

The remaining three digits identify the specific jurisdiction under each status group heading. These three digits are complemented by a publicly recognizable number.

Examples:

5.3030: Zone 5: Calgary (Public) School District No. 19.
3.7020: Zone 3: St. Albert Protestant Separate School District No. 6.
3.2190: Zone 3: County of Strathcona No. 20.
5.1290: Zone 5: Drumheller Valley School Division No. 20.
3.6010: Zone 3: Thibault R.C. Public School Division No. 35.
6.5010: Zone 6: Barons Consolidated School Division No. 8.

The jurisdiction code in Table IV may be used to access further comparative context data presented in Appendix 4. This appended information enables an appreciation of the school jurisdiction situation applying to each municipality, including aspects of: scale; assessment mix and extent; fiscal capacity; mill rate; and operating expenditures.

PART IV: USER'S AND TECHNICAL NOTES
SCHOOL TAXATION: SIGNIFICANCE, COMPARATIVE CONTEXT AND MARKET VALUE RELATIONSHIP

• Enables a quick appreciation of the position of a municipality in relation to the average shown at the bottom of the page.

• Indicates the relative significance of school taxes in the total property tax bill.

• Represents an aggregate situation for the entire municipality. Can be used for those cases where no survey was returned.

• Supplementary School Requisition Mill Rate Index is not comparable directly to the S.S. Req. Index, which is for the sample property.

• Used to gauge the representativeness of the sample property and the accuracy of the market value estimated within the same school jurisdiction.

• Alberta Municipal Affairs (Nov. '87)

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

• The total population for the municipal type is divided by the number of municipalities, e.g. Total Cities Pop./17.

• See the Introduction to Part IV for an explanation. Also refer to Appendix 3 for the details of each School Jurisdiction.

• Supplementary School Requisitions are collected by the municipality for the school authority.

• Total Property Tax includes requisitions, municipal taxes and special assessments on the sample bungalow.

• Supplementary School Requisition as a percentage of Total Property Tax on the sample bungalow.

• Total Supplementary School Requisitions for a municipality divided by the total equalized assessment.

• Supplementary School Requisition as a percentage of market value of the sample property.

PART V:
UTILITY CHARGES

PART V: UTILITY CHARGES

Introduction

Utility charges comprise a significant portion of the direct costs for a residential property-owner. This is particularly the case for urban households. **Total aggregate costs** (T.A.C.) are the combination of total property taxes (T.P.T.) and total utility charges (T.U.C.). For quick comparisons a **T.A.C. Index** has been included. Table V features cities, towns and villages only. Elsewhere, utility charges are of little or no significance for most rural municipalities and summer villages.

Of all utility charges, Table V recognizes those associated with **water supply, sewer service,** and **solid waste management**. The combined influence of these utility elements, in relation to total aggregate costs, is shown in the table (**Utility Charges as a % of T.A.C.**). The comparative significance is brought out in an associated Index.

The annual charges developed for each utility service are indicated in the table. In the cases of water and sewer the amounts were derived by applying the reported rates of charge to a standard volume of water consumption. (For more details refer to the Introduction to Part I.)

Few municipalities have *solid waste* management service charges. Many recover these costs through general taxation. Where present, they are usually annual flat-rate charges. As a result, there may also be cases of cross-subsidization. For example, sewer rates may be set relatively high to offset comparatively low water rates — or vice versa.

Some 1986 AMFIS data have been provided to assist in an appreciation of the diversity of enterprise financing practices among municipalities. The **per capita net operating loss or gain** associated with each function is indicated. If the self-financing principle was adhered to, all the statistics would be very close to zero.

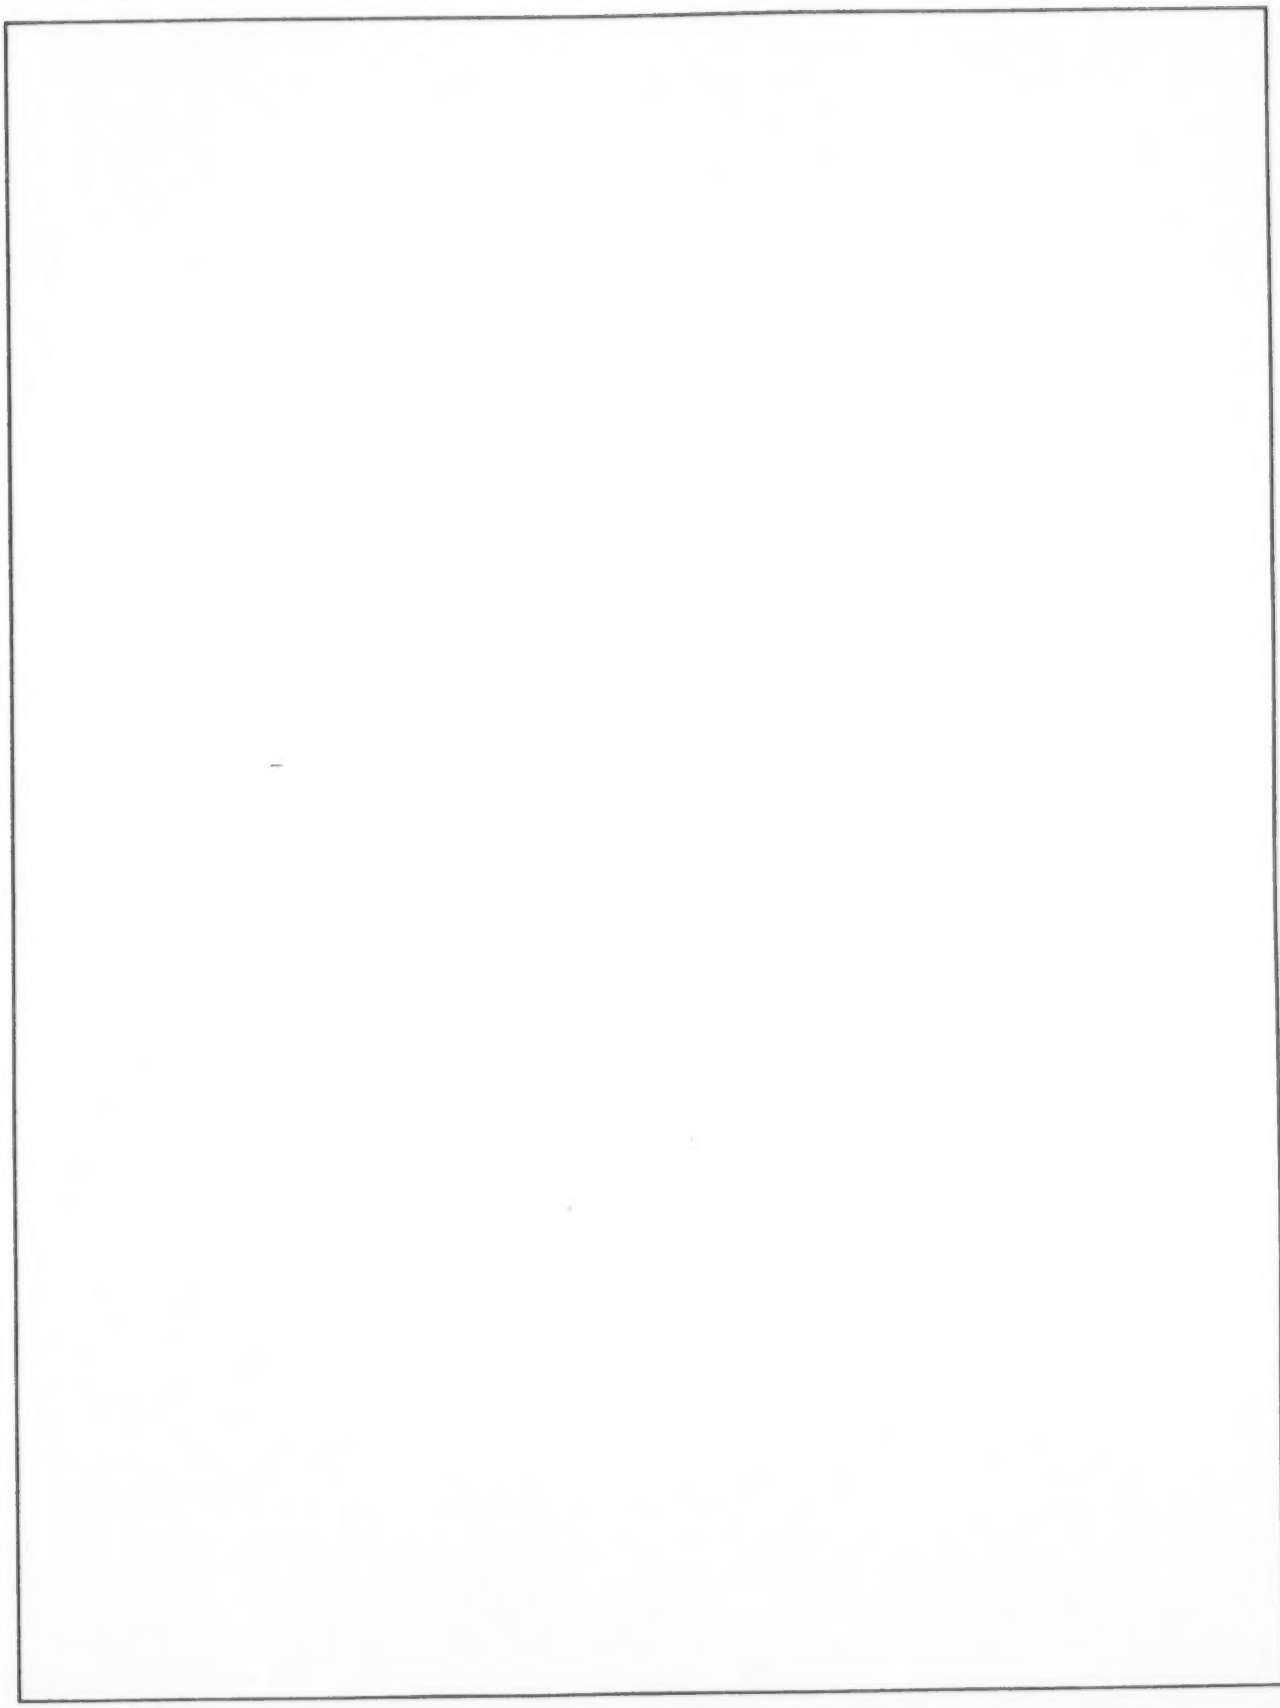
It is important to appreciate that the net operating financial circumstances can frequently change quite markedly from year-to-year. The AMFIS data presented is for 1986 (i.e. from the 1986 financial statements submitted by municipalities).

Note also the scope for considerable interrelationship with the municipal tax component of the total property tax bill.

Depending on whether a municipality chooses to run its water and sewer enterprises at a loss or a "profit," and on whether it chooses to establish a solid waste management charge, the burden of total aggregate costs could be shifted between taxation and utility service charges.

For example, a municipality may appear to have comparatively low taxation but high utility charges because of a policy requiring utilities to be self-financing, thus avoiding any imposition on the general tax base. The reverse situation may also apply where the tax bill is "loaded up" to keep utility charges low (or non-existent with respect to solid waste management). This strategy is likely to be most popular in communities with a large population of elderly people, to maximize the benefits of property tax reduction programming for senior citizens.

In an ideal world, utility rates would also be set to allow the build-up of operating and capital reserves. These would deal with emergencies and fund major renovations or replacement of deteriorated systems. A pro-active reserves policy can stave off the necessity to resort to debenturing for capital works financing. In many cases, however, this has become unavoidable, and significant debt loads are being carried. The debt service costs have to be built into the rates charged. And high utility rates are often associated with high debt loads. Statistics on the **1986 per capita debt load** for water and sewer have been included in Table V to assist in an appreciation of this factor.



PART V: USER'S AND TECHNICAL NOTES

UTILITY CHARGES: SIGNIFICANCE, UNIT COSTS AND COMPARATIVE NET COSTS/DEBT DATA

- Compare the total and the index with other municipalities to appreciate the burden on the sample property.
- Compare the total annual utility charges for each component.
- The standard volume serves to smooth out the influence of different consumption patterns and impacts from the size of the family living in the sample bungalow.
- If self-financing principle was adhered to, all statistics would be close to zero.
- Negatives = expenditures are greater than revenues. Positives = revenues are greater than expenditures.
- High utility rates are often associated with high debt loads.
- Compare the per capita totals for water and sewer enterprise functions.

Municipality	Sample Property: Utility Charges Significance				Annual Unit Costs			Net Annual Costs (1986:AMFIS)			Utility Debt (AMFIS)	
	Total Aggregate Cost (TAC) ($)	T.A.C. Index (Avg.=100)	Utilities Charges % of TAC (%)	Util. Charges As % of TAC Index (Avg.=100)	Water Charges (360 cu m) ($)	Sewer Charges (360 cu m) ($)	Solid Waste Charges ($)	Net Operat. Loss (-)/Gain per capita Water ($/PC)	Sewer ($/PC)	Solid Waste ($/PC)	1986 Debt Load per capita Water ($/PC)	Sewer ($/PC)

		*****		*****								

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

- Annual total property taxes plus (+) utility charges on the sample bungalow in cities, towns and villages.
- Annual utility charges for water, sewer and solid waste (combined) as a percentage of the Total Aggregate Cost.
- Municipal utility rates are applied to a standard volume (360 cu.m.) at an average rate of 30 cu.m. per month.
- Annual charges by the municipality for solid waste service on the sample bungalow.
- Annual operating revenues less expenses divided by municipal population. These financial circumstances can change markedly from year-to-year.
- The Total Debt associated with each function is divided by the population.

APPENDIX 1:

CHARACTERISTICS OF SAMPLE PROPERTY

APPENDIX 1: CHARACTERISTICS OF SAMPLE PROPERTY

Introduction

You can use the information in this Appendix to determine the similarity of the reported properties and how comparable the taxes are.

Live assessment, among the first data shown in the Table, is not directly comparable between individual municipalities. Varying reference manuals, base years and general re-assessment dates, all contribute to making assessment data uncomparable. The live or actual assessments for each sample property were used to determine the various components of the total property tax.

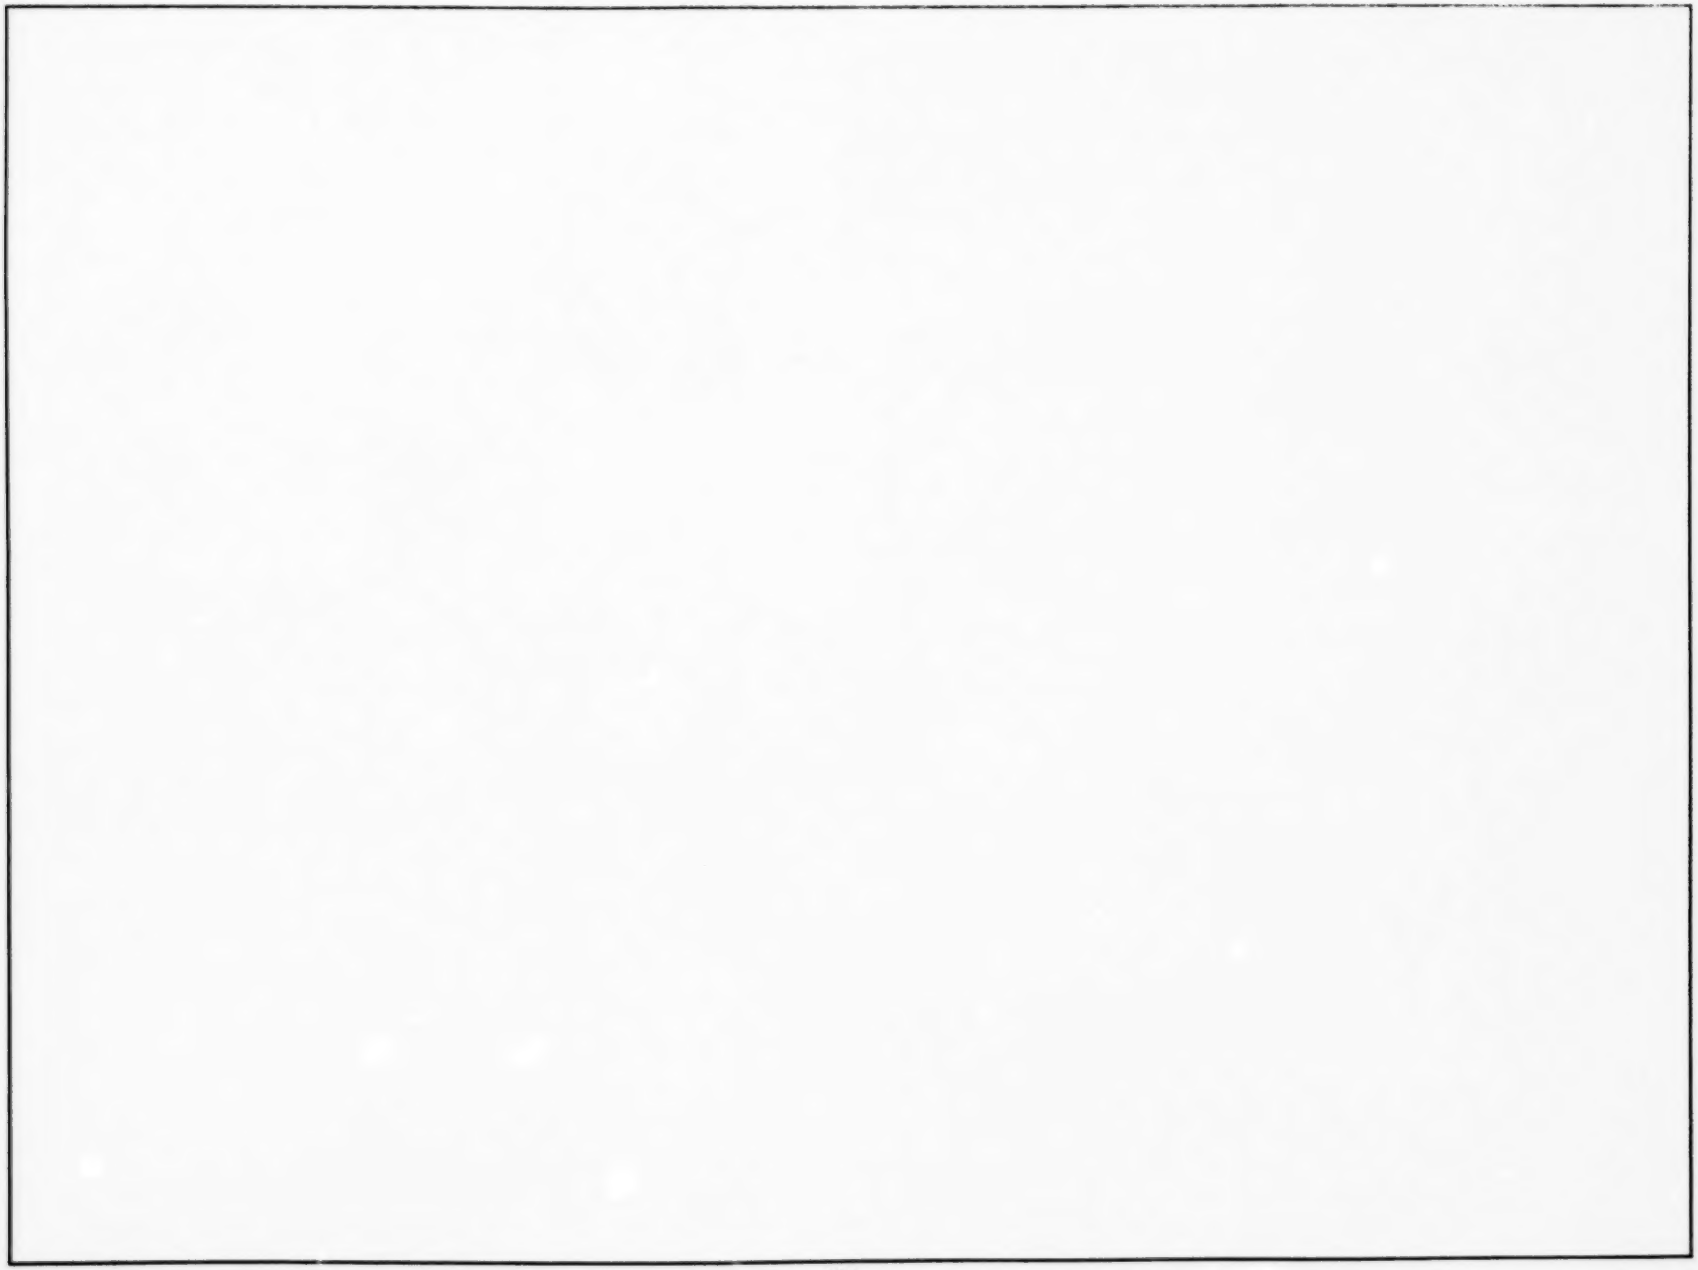
To ensure the properties are comparable, three physical characteristics were requested. The first is **year built**. This refers to the year in which the bungalow was constructed. The survey instrument requested a five-to-ten year-old bungalow.

The reported data includes a wide range and care should be taken to ensure roughly similar-aged homes are being compared. The requested **bungalow size** was 110 square meters (about 1200 square feet). Only a few municipalities reported this exact size. Finally, the **lot size** in area (sq. metres or hectares) or by lot dimensions (meters) should be comparable. As with the previous characteristics, the reported lot sizes varied from municipality to municipality.

As a rule, select properties with similar physical characteristics to increase the confidence in your comparisons.

Each property you are comparing should also be subject to similar types of taxes. This applies particularly to the **special levy** (frontage charges) component. For many municipalities, special levies are insignificant. In the remaining cases, this levy is used to allocate particular service costs. As you would expect, the (dollar) tax amounts will vary.

The survey data contained in this Table form the basis for the five Parts of this report. Property tax and utility charges information gathered through the survey is presented in Part I of this report. The various property tax components and utility service costs are further detailed and examined in subsequent Parts.



APPENDIX 1: USER'S AND TECHNICAL NOTES
CHARACTERISTICS OF SAMPLE PROPERTY

- Use the municipality's population to locate it in Parts I to V. There, municipalities are listed by population (Hi to Lo).
- Alberta Municipal Affairs (Nov. '87)

- Live assessments shown are not directly comparable between municipalities except in comparatively rare cases.

- The survey requested a 5-to-10 year old bungalow. Compare similar aged properties.

- Compare similar sized bungalows. The requested one was 110sqm.

- Use comparable lot sizes.

- Compare totals for similar municipalities.

- The municipalities are listed alphabetically for easy reference in this Appendix.
- The year the last general assessment became effective for taxation purposes.
- Live assessment for each sample property is used to calculate total property taxes.
- If a measurement conversion is needed refer to the User's Guide.
- Taxes collected for a regional and/or provincial authority.
- Frontage charges and local benefit assessments to property.
- Taxes for municipal purposes.
- Total taxes includes requisitions, special assessments and municipal taxes.

APPENDIX 2:

ROYAL LEPAGE SURVEY: HOUSE PRICES AND TAXATION COMPARISON

APPENDIX 2: ROYAL LEPAGE SURVEY: HOUSE PRICES AND TAXATION COMPARISON

Introduction

The real estate firm, Royal LePage, issues a quarterly report on Canadian house prices. The prime concern is with house price fluctuations. Their survey also includes information on property taxes. As a result, the LePage report is of value for corroboration purposes and also for additional insights regarding dynamics and intra-city variations in the metropolitan contexts. For example, the Alberta component of the Royal LePage Survey focuses on Calgary (13 different neighbourhoods), Edmonton (7 neighbourhoods) and 11 other cities.

Of the six housing types covered in their survey, one — the detached bungalow — is very similar to the standard sample property prescribed for this report. The Royal LePage detached bungalow is described as follows:

> "A detached, three-bedroom single-storey home with 1 1/2 bathrooms and a one-car garage. It has a full basement but no recreation room, fireplace or appliances. Using outside dimensions (excluding garage), the total area of the house is 111 sq. metres (1,200 sq. ft.) and it is situated on a full-serviced, 511 sq. metre (5,500 sq. ft.) lot. Depending on the area, the construction style may be brick, wood, aluminum siding, or stucco."

The Royal LePage Survey contains quarterly data for house **prices** and **taxes**. These raw data have been further manipulated to derive averages, and to compute tax/price incidence values that can be compared with the ones developed for Part I of this report. It is important to recognize that the statistical averaging is based on the Royal LePage figures, but the resulting statistics should not be attributed to Royal LePage.

The Royal LePage figures reflect data and opinions supplied by company personnel with respect to a "fair market value" estimate. The Survey properties are deemed to be within average commuting distance to the city centre and are typical of other housing in the neighbourhood (classed as "average," rather than "prime," in the case of the detached bungalow properties).

The general limitation stated by Royal LePage is as follows:

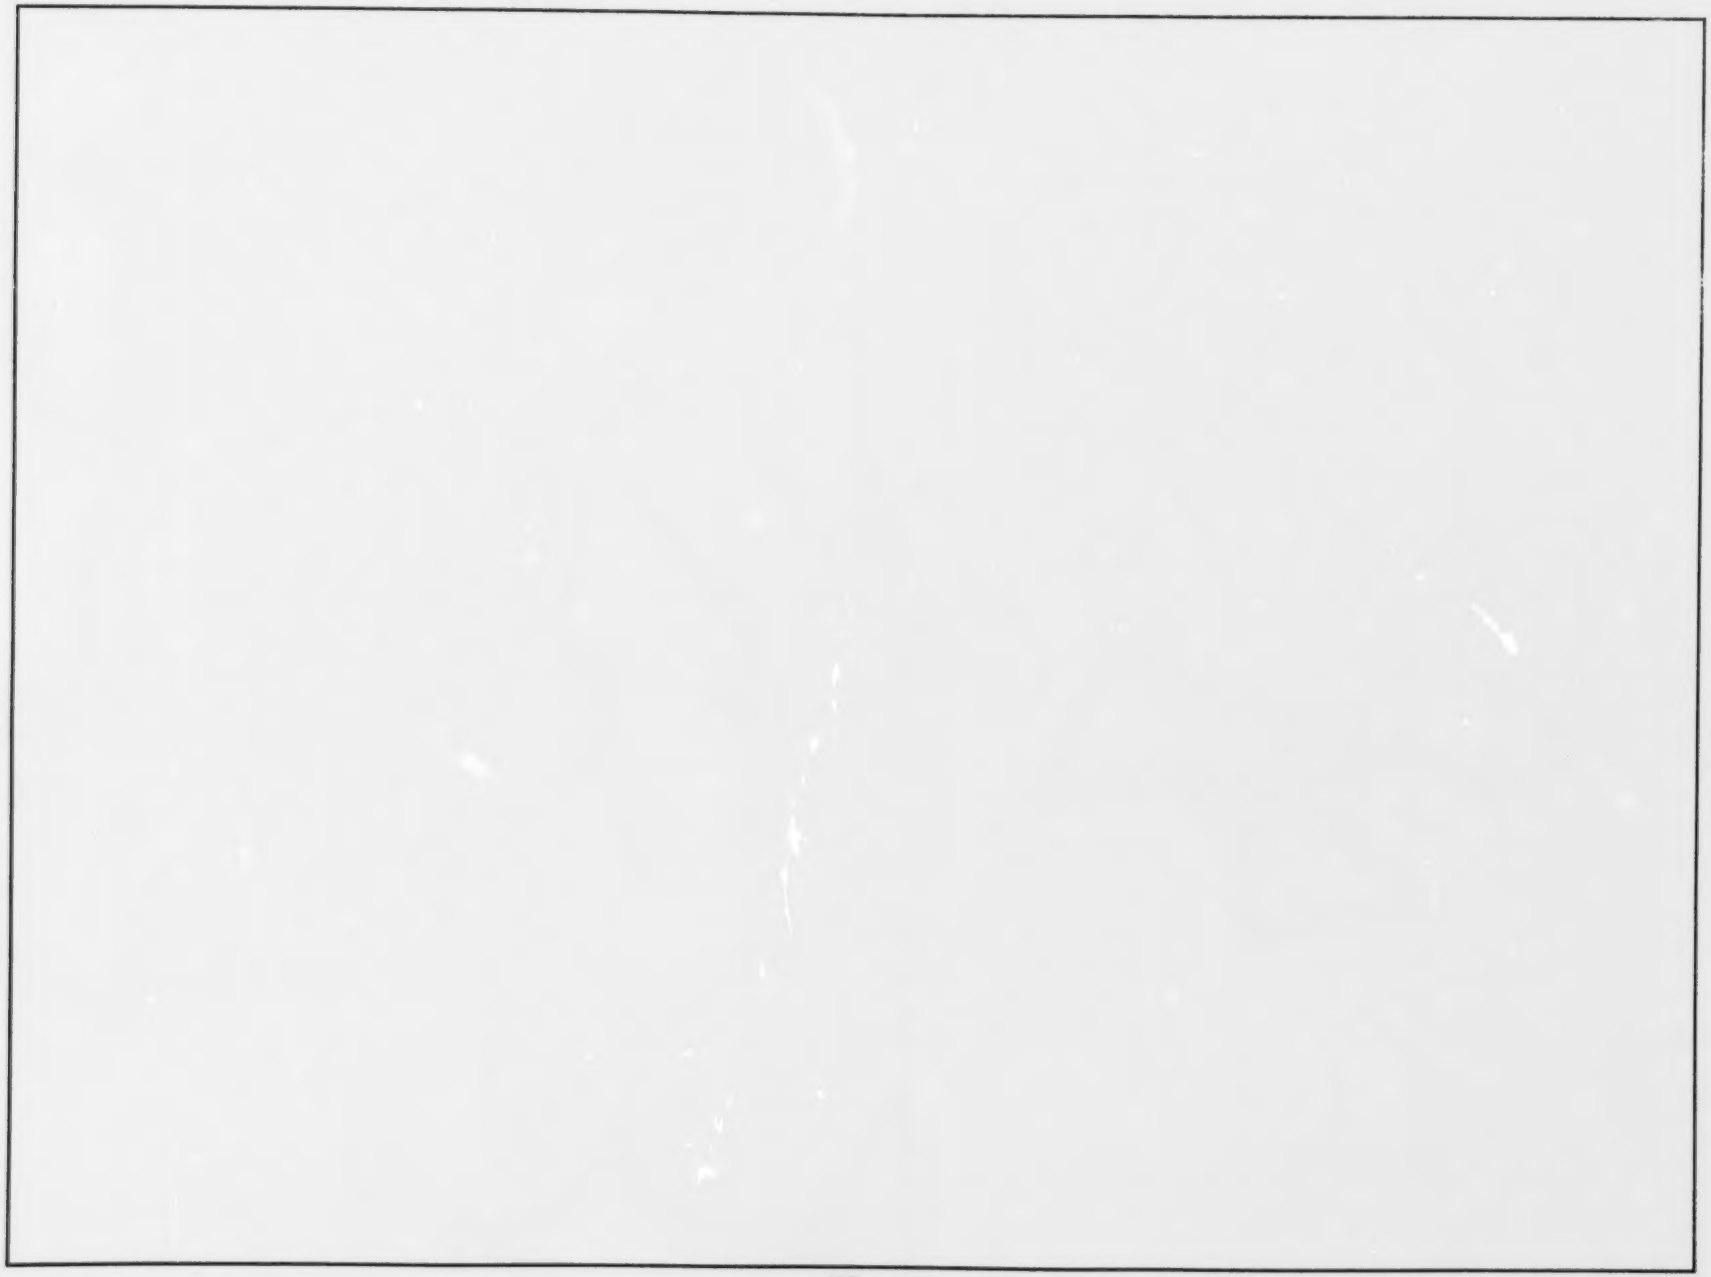
> "All material contained herein is for general information purposes only. Royal LePage cannot and does not assume responsibility for any actions or decisions undertaken by any person in reliance on information, estimates, or opinions contained or expressed herein."

The Royal LePage estimates for taxes are considered to be somewhat less reliable than their house price estimates. However, any deficiency in this regard is considered to be reduced by the use of period averages. The Royal LePage Survey taxes are comparable with the total property taxes in this report. There could be some scope for discrepancies where one survey picked up some unusual special municipal levies activity which was not registered in the other survey. With such caveats in mind, a quick comparison of the two surveys may be accomplished by reference to the average price and average taxes statistics in Appendix 2, and the total property taxes and market value figures in Appendix 1. The tax/price incidence statistics in Appendix 2 may be compared with the same statistic in the mid-part of Table 1 (i.e. Total property tax as a percentage of market value; but do not compare it with the total aggregate costs referenced in the last column).

An inspection of the statistics from each survey indicates some contrasts in the taxes and market value figures. However, there is a good degree of similarity between the tax/price incidence statistics for the same municipality. In general, where there are discrepancies these amount to no more than one-or-two-tenths of a percent.

This suggests that a fair degree of confidence can be placed in the Residential Property Survey data — for the cities at least.

For those who may be interested in further utilizing the Royal LePage figures, there is a wealth of comparative data available stretching back over ten years, for about 185 locations Canada-wide. Alberta Municipal Affairs gratefully acknowledges permission from Royal LePage to use the figures presented in this Appendix.



APPENDIX 2: USER'S AND TECHNICAL NOTES
SELECTED HOUSE PRICE AND TAXATION COMPARISONS (ROYAL LEPAGE SURVEY 1986-'87)

• Compare monthly house prices for these five survey dates.

• Compare total annual property taxes for these five survey dates.

• Compare tax incidence for each survey period.

• These annual averages are comparable to the market value and the municipal property taxes for the sample bungalow in this report.

• These areas provide additional data about the range of residential markets within urban centres.

• Like market value, house price represents the resale value of the (LePage) bungalow which is similar to the surveyed property featured in this report.

• Monthly property taxes on a similar sized bungalow.

• Property taxes as a percentage of the house price for the five survey dates.

• Average annual house price and taxes for the five survey dates shown in this Appendix (i.e. for the period October '86 through October '87).

APPENDIX 3:

RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

APPENDIX 3: RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

Introduction

In the case of rural municipalities, the survey focused on two types of residential property, i) a three-acre parcel, thought to be particularly suitable for comparisons **between** rural municipalities, and ii) a standard residential lot in a designated hamlet or other unincorporated urban community serviced by the rural municipality. The latter was used throughout this report with the hope of providing some comparability between rural municipalities and urban municipalities. It should be appreciated, however, that in many cases the bulk of the population in most rural municipalities reside on neither type of property, but instead lives on farms. The information presented in Appendix 3 is intended in part to remedy this deficiency.

Appendix 3 includes two density statistics to further assist any comparative analyses. The first is **Population per square kilometre**. In the case of the **Road density**, the reference is to local and secondary roads where the rural municipality has some or all the servicing responsibility. (It does not include any primary or forestry roads, nor any roads classed "not open.")

The presentation is organized on the basis of Alberta Agriculture's six regions.

It uses the **Number of Farms** data from that department's recent report on the 1986 Alberta Census of Agriculture. These statistics, in conjunction with other information on the total number of dwellings (from Alberta Municipal Affairs records), have been used to derive a crude estimate of **"non-farm" dwellings**. These data have permitted the estimation of comparative taxation levels for the average farm and the average non-farm.

Property tax per farm has been estimated from 1986 AMFIS information on the taxes raised from "farmland" properties, divided by the number of census farms. The "non-farm" statistic recognized taxes raised from "residential" properties as well as any special assessments and mobile home licence fee revenue. These "taxes" were divided by the estimate of non-farm dwelling units. Apart from the crudeness of the latter estimates, the value of the unit statistics is heavily dependent on the accurate reporting of the breakdown of property taxes in Schedule FS5 of the Alberta Municipal Affairs financial statements for municipalities. Both sets of unit taxation are complemented with average **index statistics**, referenced to the relevant agricultural region average. These permit an at-a-glance relative positioning of individual municipalities.

The fiscal capacity statistics furnish the means to begin to explain the differences observed in the unit taxation data. **Equalized assessment per kilometre** is of particular significance for rural municipalities because of the importance of the road maintenance/construction function (often accounting for around two-thirds of total operating expenditures). An appreciation of the quality of the average farm is provided in the measure of **farmland equalized assessment per farm**. Similarly, the quality of the average non-farm residence is indicated by the measure of **non-farm residential equalized assessment per non-farm residence**. Relatively high levels of fiscal capacity by any of these three measures signifies the likelihood of high service level expectations and high tax rate tolerances, and vice versa.

A useful profile of each rural municipality can be quickly obtained by reference to the equalized assessment composition statistics. Fundamental differences are readily apparent in the contrasting significance of **farmland, non-farm residential development**, and **non-residential** (industrial/E.P.P.L/ machinery and equipment) **assessment**. The best-off rural municipality residents are those with a high percentage of non-residential assessment to share their tax burden. Complex situations are created where there are high levels of non-farm residential development (e.g. acreages, country estates, hobby "farms").

Rural municipalities with farmland dominating their assessment are now the exception rather than the rule. However, most continue to exert a strong farmland dominance over non-farm residential development, and some are also blessed with healthy levels of non-residential assessment. It should be appreciated that the three percentages indicated may in some cases exceed 100%: this is because some farmland equalized

assessment may also be classed as subject to the School Foundation Program Fund Levy (e.g. corporate farm situations).

A final caution on the farm/non-farm distinctions made in this Appendix is in order. It is assumed that each farm is associated with one dwelling unit. In actual fact a single farm operation may involve more than one non-taxable residence. In other cases a census farm may involve no occupied dwelling unit (meaning the operator lives off the farm). It has proved expedient to assume that these situations balance out in every case.

APPENDIX 3: USER'S AND TECHNICAL NOTES
RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

• Compare these characteristics with other rural municipalities within and between regions.

• Compare farm and non-farm annual property taxes using the totals and the indices.

• Compare these fiscal capacities with the region's average.

• High levels of fiscal capacity by any of these measures signify the likelihood of high service level expectations.

• The best off residents have a high percentage of SFPF assessment to share their tax burden.

• Compare the levels of non-farm residential developments and contrast it with the farmland dominance.

• NOTE: The cases greater than 100% indicates farmland equalized assessment subject to SFPF Levy (e.g. corporate farms).

• Alberta Agriculture's six Census Regions.

• The municipal population (Alberta Municipal Affairs Nov. '87) divided by the area (AMFIS).

• Roads refers to all open local and secondary roads for which a municipality has some responsibility. (It does not include primary or forestry roads.)

• Number of farms reported in Alberta Agriculture's 1986 Census.

• Those dwellings not related to a farm such as country residential, hamlets and summer resorts. This crude estimate involves: the total number of dwellings (AMFIS '86) minus the number of farms.

• Taxes from "farmland" properties in a municipality (AMFIS '86) divided by the number of census farms.

• Taxes from "residential" properties, special assessments and mobile home licence fee revenues divided by the estimated non-farm dwellings.

• Road construction is a significant expenditure for rural municipalities. Equalized assessment is the base on which taxes to recover the net costs will be levied. N.B. The large average for the South Central Region is due to I.D. #5's E.A./Rd.KM.

• Indicates the quality of the average farm and non-farm residence.

• Refer to introduction of Appendix for details.

• This is the industrial portion (industrial, EP & PL, machinery and equipment) of the assessment.

***** Indicates the situation for a municipality relative to the average shown at the bottom of the page of each table.

APPENDIX 4:

SELECTED SCHOOL JURISDICTIONS: COMPARATIVE CONTEXT DATA

APPENDIX 4: SELECTED SCHOOL JURISDICTIONS: COMPARATIVE CONTEXT DATA

Introduction

In this Appendix, a range of school jurisdiction data helps to facilitate a greater appreciation of the variations in supplementary school taxes indicated in Part IV. Only those jurisdictions identified in Table IV have been selected for inclusion in this Appendix. The selections include almost all the major school jurisdictions in Alberta; most of the omissions were small school jurisdictions. The data presented have been obtained from various Alberta Education sources.

The scale of each jurisdiction may be appreciated by reference to the information on the **number of schools operated, the resident pupil count, the adjusted equalized assessment**, and **total operating expenditures**.

The **adjusted equalized assessment** data are for the purposes of education finance. It reflects an adjustment for the **Electric Power and Pipe-Line** (E.P.P.L.) assessment within the rural municipality parts of a school jurisdiction. For school purposes this particular form of assessment is directly shared with other urban supporters of the school jurisdiction in question. To the extent that E.P.P.L. assessment is present all supporters of the particular jurisdiction are better off. The adjusted equalized assessment is the sum of the actual equalized assessment, contributed by each supporting municipality, and an imputed equalized assessment value based on the application of the net mill rate to the E.P.P.L. tax contributed by the rural municipalities. The formula is as follows:

Adjusted Equalized Assessment = Actual Eq. Ass. + [(E.P.P.L. Tax / Net Mill Rate) x 1000]. The significance of the E.P.P.L. factor is brought out in the statistic showing the **adjusted equalized assessment as a percentage of the actual equalized assessment**.

The fiscal capacity of each jurisdiction is indicated in terms of **adjusted equalized assessment per resident pupil**. This will have a strong bearing on the amount of supplementary requisition established by a school authority. Those with a strong fiscal capacity are in a position to make a comparatively large requisition in per pupil terms. Those with a weak capacity (e.g. below average) do not have this option unless they are prepared to set a very high school tax rate. However, some flexibility may be available depending on the significance of the E.P.P.L. contribution. Appendix 4 includes comparative data on the **percentage of the total requisition covered by E.P.P.L.**

Other comparative statistics include the level of **supplementary requisitions per resident pupil served**, and the **Net Mill Rate**. The latter is probably the best single comparative indicator of the school tax burden for residential property-owners.

The Net Mill Rate is computed as follows: Net Mill Rate = [(Supp Req. – E.P.P.L. Tax) / (Actual Eq. Ass.)] x 1000.

To round out the picture, information is presented on **operating expenditures** by each school jurisdiction (1985 data). The statistics show both the level of **expenditure per pupil**, and this expenditure in relation to the adjusted equalized assessment. Much of the expenditure is covered by provincial grants designed to ensure at least a foundation level of education for each pupil regardless of the jurisdiction. There is, therefore, comparatively little variability in per pupil expenditures. However, because of the wide range in fiscal capacity, the expenditure effort statistics do vary considerably.

APPENDIX 4: USER'S AND TECHNICAL NOTES
SELECTED SCHOOL JURISDICTIONS: COMPARATIVE CONTEXT DATA

• As referenced in Part IV, select the school authority using its zone, code, number and name.

• The scale of each jurisdiction is gained from this data and the total operating expenditure.

• Adjusted Equalized Assessment reflects the fact that E.P. & P.L. assessment is shared with urban supporters.

• The significance of the E.P. & P.L. factor is brought out in the Adj. E.A. as a % of the Actual E.A.

• The higher the number the greater the capacity to bear the supplementary school requisition.

• Compare the totals and the statistics to appreciate the level of expenditures and the related expenditure effort.

Jurisdiction				Schools	Pupils	Adjusted Equalized Assessment			(Adj.) E.A. Supple. School Requisition			1985 Operating Expenditures

• The first digit is the status of the school authority. The other three digits specify the jurisdiction (for details see Part IV Introduction).

• Alberta Education Zone, one of six in Alberta.

• From various Alberta Education sources.

• Net Mill Rate = [(Supplementary Requisition - EP & PL Tax)/Actual E.A.] * 1000

• A fiscal capacity indicator is derived by dividing the Adj. E.A. by the resident pupils.

• By including the EP & PL this total is greater than the Total E.A.

• The Equalized Assessment is adjusted to include the electric power and pipeline (EP & PL) portion.
